

Clarification on the approved methodology AMS-III.C version 13 regarding the requirements for demonstrating comparability of project and baseline vehicles

(Version 01)

As an alternative to the current procedures of paragraph 8 of AMS-III.C, the comparability of baseline and project vehicles may also be demonstrated by identifying matching vehicle categories according to an existing national or international standard (e.g. Corinair vehicle classes per vehicle category as described in *Table 3-6, B710-15 TO B710-17, Corinair Emission Inventory Guidebook, 2007*). If the project vehicles are not classified within the standard fossil fuel vehicle categories, then, for electric vehicles, the lowest engine size category used in the host country should be selected, and for hybrid vehicles the equivalent vehicle model/engine size as specified by the hybrid vehicle manufacturer should be selected.
